This invention describes a novel humanized anti-Fas antibody-like molecule (I) that, induces apoptosis in cells with an abnormal Fas/Fas ligand system, by binding to Fas on the cell surface, and prevents apoptosis in cells with a normal system, by inhibiting binding between apoptosis in cells with a normal system, by inhibiting binding between Fas and its ligand. The products of the invention have anti-inflammatory, cantidiabetic, anti-alergic, anti-arthritic, antidization, inflammatory, darmatological, immunosupressive, thyromimetic, antiarterioscierofic, cardiant and hepatropic activity. (I) induce apoptosis by binding to cell surface Fas or inhibit it by competitive inhibition of ligand binding. (I) are used to treat and/or prevent diseases associated with the Fas/Fas ligand system, especially systemic carpottosis by binding to cell surface Fas or inhibit it by competitive disease, sociated with the Fas/Fas ligand system, especially systemic clupus erythematosus, Hashimoto disease, pernicious or hypoplastic. Upus erythematosus, Hashimoto disease, pernicious or hypoplastic. Upus erythematosus, Basedow's disease, thrombopenia purpura, insulin disease, autoimmune hemolytic anemia, sterility, myasthenia gravis, anemia, Addison's disease, thrombopenia purpura, insulin celepatory allergy, arterioscierosis, myocarditis, cardiomyopathy, glomerulonephritis, hepatitis (fulminant, chronic, viral (B, C or D) or alcoholic, and transplant rejection. (I) selectively cells. They bind to both human and murine Fas, so can be evaluated in mutine disease models. (I) act on the active site of Fas, i.e. they minic the native ligand, do not induce liver disease, and have reduced risk of inducing a human anti-murine antibody response. This sequence represents a humanised anti-Fas antibody heavy chain construct designated Heu 2 with the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New humanized anti-Fas antibody, useful for treating or preventing e.g. inflammatory or autoimmune disease, induces apoptosis selectively in cells with abnormal Fas-Fas ligand systems
Goodpasture syndrome; Crohn's disease; sterility; myasthenia gravis; multiple sclerosis; basedow's disease; thrombopenia purpura; allergy; insulin dependent diabetes mellitus; arteriosclerosis; myocarditis; cardiomyopathy; glomerulonephritis; hepatitis; transplant rejection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 61 GQGLEWMGEIDPSDSYTNYNQKFKGKATLTVDTSTSTAYMELSSLRSEDTAVYYCARNRD 120

immunomodulatory, dermatological, immunosuppressive, thyromimmento, antinteumatic, nephrotropic, antinfertility, neuroprotective, antintermunatic, nephrotropic, antinfertility, neuroprotective, antintarteriosclerotic, cardiant and hepatropic activity. (I) induce apoptosis by binding to cell surface Fas or inhibit it by competitive inhibition of ligand binding. (I) are used to treat and/or prevent diseases associated with the Fas/Fas ligand system, especially systemic clupus erythematosus, Hashimoto disease, remandade arthritis, graft versus host disease, Sjorgen's syndrome, pernicious or hypoplastic usemia, Addison's disease, scleroderma, Goodpasture syndrome, Crohn's disease, autoimmune hemolytic anemia, sterility, myasthenia gravis, multiple sclerosis, Basedow's disease, thrombopenia purpura, insulin capendent diabetes meditius, allergy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephritis, hepatitis (fulminant, chronic, viral (B, C or D) or alcoholic), and transplant rejection. (I) selectively calloning the poptosis in normal cells but selectively induce it in abnormal cells. They bind to both human and murine Fas, so can be evaluated in murine disease models. (I) act on the active site of Fas, i.e. they minic murine disease models. (I) act on the active site of Fas, i.e. they minic the native ligand, do not induce liver disease, and have reduced risk of inducing a human anti-murine antibody response. This sequence represents a humanised anti-mas antibody heavy chain construct designated Heu 3 which is described in the method of the invention.
apoptosis in cells with a normal system, by inhibiting binding between Fas and its ligand. The products of the invention have anti-inflammatory, anti-anemic, antidiabetic, anti-allergic, anti-arthritic, antiviral,

New antibodies and proteins bind conserved epitope of Fas antigen - used to evaluate drugs in animal models and to treat Fas-associated diseases e.g. autoimmune disease, allergy, atopy, arteriosclerosis, myocarditis, hepatitis and AIDS

Claim 22; Page 212-213; 292pp; English.

This is the amino acid sequence of the VD type humanised heavy chain of murine anti-human Fas monoclonal antibody HFE7A. E. colipgHSL7A62 SANK 73397 harbors plasmid pgHSL7A62 carrying a fusion fragment of the humanised VD type HFE7A heavy chain and DNA encoding human 1gGl constant region (see AAV70079), and is deposited as FERA MP-6074 (claimed). The invention provides methods for producing humanised antibodies by culturing host cells. Humanised versions of HFE7A (see AAW83031-37), like native HFE7A, are capable of inducing apoptosis in abnormal cells expressing Fas, and of inhibiting Fas-induced apoptosis in normal cells. The humanised antibodies are used to evaluate, in animal models, treatments of diseases that involve Fas/Fas ligand interactions, and also to

containing an anti-Fas antibody as the active component. The anti-Fas antibody is either the murine anti-human Fas monoclonal antibody HFETA, or a humanised version of HFETA containing identical CDRs (complementarity determining regions) to antibody HFETA. Via its interaction with Fas, the antibody of the invention may therefore be used interaction with Fas, the antibody of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in the treatment or prevention of conditions such as autoimmune diseases, allergy, atopy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephritis, aplastic anaemia (panmyelophthisis), hepatitis, AIDS and organ graft rejection. Sequences AAB14775 B14776 and AAB14779 represent the heavy chains (or fragments thereof) of various humanised HFETA-derived anti-Fas antibodies.
                                                                                                                                                                          by an abnormality
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to compositions for the prevention or treatment

New humanized anti-Fas antibody, useful for treating or preventing e.g. inflammatory or autoimmune disease, induces apoptosis selectively in cells with abnormal Fas-Fas ligand systems

Example reference 15; Page 134-136; 263pp; English.

This invention describes a novel humanized anti-Fas antibody-like

molecule (I) that, induces apoptosis in cells with an abnormal Fas/Fas

ligand system, by binding to Fas on the cell surface, and prevents

computosis in cells with a normal system, by inhibiting binding between

Eas and its ligand. The products of the invention have anti-inflammatory,

anti-anemic, antidiabetic, anti-allergic, anti-arthritic, antiviral,

computation of antidiabetic, anti-allergic, anti-arthritic, antiviral,

immunomodulatory, darmatological, immunosuppressive, thyromimetic,

antirheumatic, nephrotropic, antilnfertility, neuroprotective,

contiarterioscleroric, cardiant and hepatropic activity. (I) induce

antirheumatic, nephrotropic, antilnfertility, neuroprotective,

continibition of ligand binding to cell surface Fas or inhibit it by competitive

computosis by binding to cell surface Fas or inhibit it by competitive

continibition of ligand binding. (I) are used to treat and/or prevent

continibition of ligand binding, (I) are used to treat syndrome, crohn's

confidence and anti-man and respectable appropriation of ligans, and transplant rejection. (I) selectively

continibit apoptosis in normal cells but selectively induce it in abnormal

continibit apoptosis in normal cells but selectively induce it in abnormal

colls. They bind to both human and murine Fas, so can be evaluated in

continibit apoptosis in normal cells but selectively induce it in abnormal

colls. They bind to both human and murine Fas, so can be evaluated in

contining a human anti-murine antibody response. This sequence represents

continued anti-man anti-murine antibody response. This sequence represents

continued anti-man anti-murine antibody response. This sequence represents

Sequence

                                                                                                                                                                                                                                 This invention describes a novel humanized anti-Fas antibody-like
molecule (I) that, induces apoptosis in cells with an abnormal Fas/Fas
ligand system, by binding to Fas on the cell surface, and prevents
apoptosis in cells with a normal system, by inhibiting binding between
capptosis in cells with a normal system, by inhibiting binding between
capptosis in cells with a normal system, by inhibiting binding between
capptosis in cells with a normal system, by inhibiting binding between
capptosis by antidiabetic, antilargic, antivarial, immunosupatropic activity.
Cantinheumatic, nephrotropic, antilnfertility, neuroprotective,
cantiarteriosclerofic, cardiant and hepatropic activity. (I) induce
antiarteriosclerofic, cardiant and hepatropic activity. (I) induce
capptosis by binding to cell surface Fas or inhibit it by competitive
capptosis by binding to cell surface Fas or inhibit it by competitive
capptosis by binding to cell surface Fas or inhibit it by competitive
capptosis system, especially systemic
clupus erythematosus, Hashimoto disease, rheumatoid arthritis, graft
versus host disease, Sjorgen's syndrome, pernicious or hypoplastic
clupus erythematosus, alergy arteriosclerosis, myocarditis,
cardiomyopathy and memolytic anemia, sterility, myasthenia gravis,
cardiomyopathy apomerulonephritis hepatitis (fulminant, chronic, viral
cells. They bind to both human and murine Fas's oc can be evaluated in
cells. They bind to both human and murine Fas's so can be evaluated in
cells. They bind to both human and murine Fas's oc an have reduced risk of
inducing a human anti-murine antibody response. This sequence represents
ca humanised anti-Pas antibody HEPA heavy chain construct HHH type
cynthic is described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      alpha fused to the C-terminus of the heavy chain of the human monoclonal antibody 425 (hmAb425). The hmAb425 has specificity for the human EGF receptor. The invention claims for a new pMCLDHAP tricistronic vector (AAV18096) for the expression of an antibody-cytokine fusion protein, hmAb425-TNF alpha. The TNF alpha sequence can be substituted by the IL-2 sequence. The vector also contains a strong promoter/enhancer unit, a selection marker gene and at least two poliovirus derived internal ribosomal entry site (IRES) sequences. The vector can be expressed in mammallan host cells for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          production of heteromeric fusion proteins. This expression system is claimed to produce the heteromeric proteins in high yields.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1 MGWSCIILFLVATATGVHSQVQLVQSGAEVKKPGASVKVSCKASGYTFTSYWMQWVKQAP 60

(S)
This invention relates to a combination of an anti-Ep-CAM (cyclic adenosine monophosphate) antibody with a chemotherapeutic agent, that is capable of arresting Ep-CAM antigen expressing cells in the synthesis (5) phase or the second growth phase (M) of cell enlargement (G2)/DNA replication. The antibody exhibits cytostatic activity and is useful in the manufacture of a medicament for use in anti-cancer therapy, characterised in that a chemotherapeutic agent, which is capable of arresting Ep-CAM antigen expressing cells in S or in G2/M, is co-administered to a patient with an anti-Ep-CAM antibody. The combination is useful for treating cancer, particularly colorectal cancer, breast cancer, gastric cancer, prostate cancer or non-small-cell anti-Ep-CAM antibody known as humanised 323/A3 (IgGI) which can be used in the combination of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Anti-CD20 antibody; dimeric immunoglobulin; immunoglobulin; IgG; complement system; Fcgamma receptor; cytotoxic effector cell; host immune cell; programmed cell death; allergic disorder; cancer; autoimmune disease; allergic asthma; atopic dermatitis; Crohn's disease; allergic bronchopulmonary aspergillosis; allergic rhinitis; cancer; Graves's disease; food allergy; allergic contact dermatitis; cancer; B-cell lymphoma; rheumatoid arthritis; ulcerative colitis; psoriasis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              240

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence represents a dimeric anti-CD20 light chain

polypeptide. The dimeric immunoglobulin is used in the method of the
invention. The specification describes a method for producing an
immunoglobulin (19) G/IgG dimer. The method comprises genetically
complemering a monoclonal antibody to introduce a cysteine molecule
which inhibits formation of intramolecular disulphide bridges between
sister heavy chains on the same antibody molecule. The dimer is a
complement system, and has the ability to activating components of the
complement system, and has the ability to activate and kill cells via the
complement system, and has the ability to activate and kill cells via the
complement system, and has the ability to activate and sill of programma
complement system, and programmed cells and on host immune cells, and is
capable of initiating programmed cell death. The IgG/IgG dimers may be
used to treat allergic disorders, cancers and autoimmune diseases such
as allergic asthma, allergic bronchopulmonary aspergillosis, allergic
inhibits, atopic dermatitis, Crohm's disease, food
allergies, allergic contact dermatitis, Claucacres and/or B-cell
incomplements. They may allow be used to treat a range of other diseases and

                               The present chimeric sequence is full length 2403 immunoglobulin G (1gG) antibody heavy chain (5F2.4H4.1E3) derived from murine heavy chain (variable region (VL) and human 1gG heavy chain constant region.

This antibody binds to prostate stem cell antigen (PSCA) which is a single subunit glycoprotein that is expressed on the cell surface as a glycosylphosphalidylinositol (GPI)-anchored protein. The present invention relates to anti-PSCA antibody composition and methods of killing PSCA-expressing cancer cells. PSCA is useful for inhibiting and killing the growth of PSCA-expressing cancer cells such as prostate cancer, bladder cancer or lung cancer cells. Humanised antibody conjugated to a toxin or a radioactive isotope is used for killing the cancer cells in vivo and for inhibiting or killing these cells in vivo and for inhibiting or killing these cells in vivo and for inhibiting or killing these cells in the attibodies are also useful for treating the above mentioned cancers and for immunoprecipitation of PSCA-expressing cancer, for purification of PSCA from cells, and for detection and quantitation of PSCA in vitro. PSCA bNA is also useful for treating cancers by gene therapy techniques.
                                                                                                                                                                                                                                                                                                                                            ï

This invention relates to a combination of an anti-Ep-CAM (cyclic adenosine monophosphate) antibody with a chemotherapeutic agent, that is capable of arresting Ep-CAM antigen expressing cells in the synthesis (5) phase or the second growth phase (M) of cell enlargement (G2)/DNA replication. The antibody exhibits cytostatic activity and is useful in the manufacture of a medicament for use in anti-cancer therapy, characterised in that a chemotherapeutic agent, which is capable of arresting Ep-CAM antigen expressing cells in S or in G2/M, is co-administered to a patient with an anti-Ep-CAM antibody. The combination is useful for treating cancer, particularly colorectal cancer, breast cancer, gastric cancer, prostate cancer or non-small-cell anti-Ep-CAM antibody known as humanised 323/A3 (IgG1) which can be used in the combination of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Combination for treating cancer (e.g. breast, gastric or prostate cancers), or in the manufacture of a medicament for anti-cancer therapy, comprises an anti-Ep-cyclic adenosine monophosphate antibody with a chemotherapeutic agent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          117
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             240

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 16, 18

Sequence 14, Application US/09296005
Patent No. 6200957
GENERAL INFORMATION:
TILLE OF INVENTION: Improved Anti-1gE Antibodies and Method of Improving Polypept1
FILLE REFERENCE: PILIZGLT
CURRENT APPLICATION NUMBER: US/09/296,005
CURRENT FILING DATE: 1999-04-21
EARLIER PILING DATE: 1999-04-21
EARLIER FILING DATE: 1999-07-02
NUMBER OF SEQ ID NOS: 26
                                                                                                                                                                                                                                                                 ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ä

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Ig gamma 2b chain constant region - pig (fragment)
C;Species: Sus scrofa domestica (domestic pig)
C;Date: 21-Reb-1997 #sequence_revision 21-Feb-1997 #text_change 21-Jan-2000
C;Accession: 147160
R;Kacskovics, I.; Sun, J.; Butler, J.E.
J. Immunol. 153, 3565-3573, 1994
A;Title: Five putative subclassess of swine IgG identified from the cDNA sequences of A;Reference number: 147158; MUID:95015845
A;Accession: 147160
A;Status: preliminary; translated from GB/EMBL/DDBJ
A;Molecule type: mRNA
A;Residues: 1-328 <KAC>

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Description

David, would you please do interferences search only for following proteins. All of them are small proteins. The case is due this biweek.

- 1. a single protein sequence: X(any 18-32 aa)-SEQ ID NO:2-X(any 14 aa)-SEQ ID NO:3-X(any 32 aa)-SEQ ID NO:4-X(any 11 aa).
- 2. a single protein sequence: X(any 23 aa)-SEQ ID NO:5-X(any 15 aa)-SEQ ID NO:6-X(any 32 aa)-SEQ ID NO:7-X(any 10 aa).
- 3. SEQ ID NOs: 50, 52, 54, 107, 109, 89, 117, 143, 145, 147, 157, 107, 127, 129, 131

Depletion of T lymphocytes from allogeneic bone marrow transplants successfully prevents the development of graft-versus-host disease (GvHD) is associated with impaired engraftment, immunosuppression, and abrogation of the graft-versus-leukemia effect. We therefore explored the possibility of selectively eliminating alloreactive T cells CD95/CD95L-mediated activation-induced cell death (AICD) in a major histocompatibility complex allogeneic murine model system. Activation of resting or preactivated T lymphocytes from  ${\tt C3H}$  /  ${\tt HeJ}$  (H-2(k)) mice was induced irradiated BALB/cJ (H-2(d)) mouse-derived stimulators. with Substantial decrease (> or = 80%) of proliferative and lytic responses by activated alloreactive T cells was subsequently achieved by incubating the mixed lymphocyte culture with an agonistic monoclonal antibody to CD95, and residual T cells recovered did not elicit alloreactivity upon challenge to H-2(d). Depletion of alloreactive T lymphocytes by AICD was specific because reactivity to an I-A(d)-restricted ovalbumin (OVA) peptide by OVA-specific CD4(+) T cells mixed into the allogeneic T - cell pool and subjected to induction of AICD in the absence of OVA peptide could be preserved.. Adoptive transfer of donor-derived allogeneic T lymphocytes, depleted from alloreactive T cells by AICD in vitro, in the parent (C3H/He) to F(1) (C3H/He x BALB/c) GvHD model prevented lethal GvHD. The results presented suggest that alloreactive T cells can effectively be depleted from allogeneic T cells by induction of AICD to prevent GvHD and might introduce a new strategy for the separation of GvH-reactive cells and т cells mediating antiviral and graft-versus-leukemia effects.

ABSTRACT: Fas was initially described as a molecule expressed on the surface of certain cell lines that could mediate programmed cell death (apoptosis) subsequent to ligation by specific mAb. To determine whether mAb to other epitopes on the Fas molecule might mediate other functions, we generated a panel of mAb to the extracellular portion of human Fas . Significant lysis of Fas -expressing target cells was only observed when the new mAb were first bound to a solid-phase support and not when the mAb were added in solution. However, several of these mAb inhibited the killing of target cells induced by the prototypic Fas -specific mAb, CH-11. Those mAb that inhibited apoptosis of target cells mAb also blocked lysis of target cells mediated by the CH - 11 mediated by cells expressing Fas ligand. Finally, some of the Fas -specific mAb were found to co-stimulate proliferation of peripheral blood T cells in the presence of immobilized CD3 mAb. Thus, the data indicate the existence of a complex set of interactions mediated by Fas in both normal and transformed lymphoid cells that may have important implications regarding the role(s) of this molecule in regulation of immune responses.
